Scoring Note: Landing Page Grader

Live URL: https://convex-landing-page-grader.feather-motion.workers.dev | GitHub: https://github.com/Shobhit141141/convex

1. My Rubric (100 Points)

I split the 100 points into three areas so it is obvious whether a page has weak messaging or a broken conversion flow. An LLM (`gpt-4o-mini`) helps score the 5 copy checks from 0 to 10 using quotes from the page, while the final score is calculated deterministically in TypeScript:

- **Persuasion (50 pts):** Problem fit in the hero (10 pts), clear outcome and time-to-value like "live in 45 days" (12 pts), named customer proof with numbers rather than just logos (10 pts), buyer workflow language like Workday/ServiceNow (10 pts), and offer relevance (8 pts).
- **Execution (35 pts):** CTA button visible above the fold with clear action text (10 pts), button promise matching destination (8 pts), live Playwright click test confirming a working form or modal actually opens (10 pts), and form length (7 pts for ≤4 fields). If a page has no primary CTA, Execution is capped at 7/35; if it is a lead-gen page with no working form, Execution is capped at 10.5/35.
- **Experience (15 pts):** Pulled live from Google PageSpeed Insights API: mobile LCP (5 pts), layout shift / CLS (4 pts), mobile viewport tag (3 pts), and basic H1 + copy structure (3 pts).

2. How It Changes by Audience

The grader first detects who the page is for (enterprise buyer, functional team lead, self-serve/PLG user, or someone reading/watching content) and changes what matters most so it generalizes across any B2B or SaaS site:

SIGNAL	ENTERPRISE BUYER (E.G. LEENA.AI, OKTA.COM)	FUNCTIONAL LEAD (E.G. /FUNCTION/HR)	SELF-SERVE / DEV (E.G. TWELVELABS.IO, LINEAR.APP)	CONTENT / WEBINAR (E.G. CHRISTUS-WEBINAR)	WHY
Customer ROI & Security (SOC2 / ISO)	**1.5x weight**	1.0x weight	0.7x weight	0.5x weight	An executive booking a sales call needs ROI proof and security badges; a self-serve user or webinar viewer does not.
Daily Tool Fit (Workday, Slack, Jira)	1.0x weight	**1.5x weight**	1.2x weight	0.7x weight	HR and IT leads care most about whether the tool plugs into the systems they already use every day.
Self-Serve Trial / Sandbox ("Try Free")	0.7x weight	0.9x weight	**1.5x weight**	0.6x weight	Developers and PLG users want to test the product or API immediately rather than book a 30-minute sales call.
Short Form (≤3 Fields) & Direct Access	0.8x weight	1.0x weight	1.3x weight	**1.6x weight**	Visitors clicking "Watch now" or "Try free" drop off if you put a 7-field enterprise sales form in front of them.

3. What Changed After Checking Against the Real Data

PAGE	SESSIONS	SUBMITS	RAW CVR	MAIN TRAFFIC SOURCE	FIRST RUBRIC (V1)	MID RUBRIC (V2)	FINAL RUBRIC (V3)
leena.ai/ (Homepage)	18,343	103	0.56%	69% Direct + Organic	86 / 100	94 / 100	**83 / 100**
leena.ai/function/hr	1,907	11	0.58%	58% Paid Search	94 / 100	93 / 100	**80 / 100**
christus-health-webinar	12,437	14	0.11%	79% Paid Social	95 / 100	93 / 100	**77 / 100**

- **First Rubric (v1: 86, 94, 95):** My first version checked basic HTML tags (is there an H1, a button, and logos?). Because all three pages had those tags, v1 ranked the CHRISTUS webinar #1 (95/100) even though it had the worst conversion rate (0.11%).
- **Second Rubric (v2: 94, 93, 93):** I added audience profiles so webinar pages weren't penalized for missing SOC2 badges, but v2 gave full credit just for finding a HubSpot `<script>` tag in the DOM and scaled up remaining points when checks were skipped, clustering all three pages at 93 to 94.
- **Final Rubric (v3: 83, 80, 77):** I removed full credit for unverified script tags, added a real Playwright click check to verify the form opens, and graded copy on specific numbers and outcomes (Persuasion: 42.2/50 on Homepage vs 39.0/50 on HR vs 36.0/50 on Webinar).

4. Biggest Disagreement: Who Is Wrong, My Grader or the Data?

- **Homepage (83 pts, 0.56% CVR) vs. HR Page (80 pts, 0.58% CVR) - Raw CVR ranking is misleading:** In raw conversion rate, `/function/hr` beats the homepage by 0.02%. Looking at the traffic split in the sheet, `/function/hr` got **58% Paid Search traffic** (high-intent Google ads, 11 form submits total), while the homepage got **69% Direct and Organic traffic** (103 submits across 18,343 visits, including casual browsers and job seekers). When adjusted for traffic channel, the homepage converts better than expected (0.57x vs 0.50x), so I trust the grader's 83 vs 80 ranking here.
- **CHRISTUS Webinar (77 pts vs. 0.11% CVR) - Both the data and my grader share blame:** The 0.11% CVR is heavily dragged down because **79% of its 12,437 visits came from cold Paid Social ads** (0% search traffic). That said, 77/100 from my grader is still a bit too generous: clicking "Watch now" opens a HubSpot lead form instead of letting cold social visitors preview a 60-second clip first.

5. What I Left Out on Purpose

- **Visual design / color / font scoring:** Subjective design taste is noisy and doesn't predict B2B form fills compared to clear copy and low-friction forms.
- **Word count & SEO keyword density:** Longer pages often convert worse on paid traffic. Once a page has at least 100 words, I grade clarity rather than length.
- **Traffic channel split inside the score:** Even though traffic mix explains raw CVR in the spreadsheet, the grader shouldn't require private analytics data to grade a public URL. It should measure the page itself.
